Beginner to Pro (+ AI Prompts)

Start from zero — formulas, tables, charts, and getting ChatGPT / Gemini to write your formulas for you.

20 essential formulas

30 ready AI prompts

5 practice files

Item	Qty	Price	=B2*C2
Rice	2	$8.00	$16.00
Coffee	4	$6.00	$24.00
Total			=SUM(D2:D3)

For students • small-business owners • office workers

by Rajesh Kumar

What's inside

1. How to use this guide
2. Excel basics
3. Smart ways to enter data
4. The 20 most useful formulas (with real examples)
5. Sorting and filtering
6. Pivot Tables – reports in minutes
7. Charts – a picture of your numbers
8. Conditional Formatting – automatic colors
9. Using ChatGPT / Gemini for Excel
10. 30 ready-to-use AI prompts
11. Practice assignments
12. Mobile, Google Sheets & a 7-day plan
13. Level up: Tables, FILTER/UNIQUE, PMT, dashboard, print, protect, Copilot
14. Shortcut cheat sheet & next steps

Practice files (in this pack)

- **03_shop_sales.xlsx** – shop sales register, product list, summary, formula lab
- **04_customer_credit_ledger.xlsx** – customer tab / credit ledger with balances
- **05_home_budget.xlsx** – monthly home budget + chart
- **06_attendance.xlsx** – class attendance register
- **07_sales_invoice.xlsx** – invoice with tax / VAT

Learn Excel Fast · Rajesh Kumar

CHAPTER 1

How to use this guide

This guide is for people who have opened Excel only a few times — or who panic the moment they do. The language is simple English, and every Excel button and term (Cell, Row, Formula, Filter) is written exactly as you will see it on screen.

How to learn: read a chapter, then open the matching practice file and do the same thing yourself. Reading alone won't teach you Excel — using it will.

- Give it 20–30 minutes a day. In 7–10 days you'll comfortably do your daily work in Excel.
- In the files: yellow cells = you type, green cells = formulas (don't overwrite them).
- Something broke? Don't panic — press Ctrl + Z (Undo).
- Works on Excel 2016/2019/2021/365, Google Sheets and mobile Excel. XLOOKUP exists only in Excel 2021/365 and Google Sheets — use VLOOKUP in older versions.

💡 **Tip:** If a yellow bar saying **Enable Editing** appears when you open a file, click it — otherwise formulas won't work.

The golden rule of Excel

One cell, one piece of information. Don't write “Maria – $50 – 5th” in one cell. Put name, amount and date in three separate columns. Only then can Excel add, filter and chart your data. This one habit removes half your problems.

Every column gets a header. Put clear names in the first row (e.g. “Date”, “Amount”). Don't leave blank rows or columns in the middle.

Learn Excel Fast

CHAPTER 2

Excel basics

Excel is one big grid. Vertical strips are **Columns** (A, B, C...) and horizontal strips are **Rows** (1, 2, 3...). Where a column and a row meet is a **Cell** — e.g. C5 = column C, row 5.

G5 *fx* `=E5*F5`

	A	B	C	D	E	F	G
4	Date	Code	Product	Category	Qty	Price	Amount
5	10/01/2026	P06	Biscuits	Snacks	3	$1.00	**$3.00**
6	10/02/2026	P01	Rice 5kg	Grocery	2	$8.00	$16.00
7	10/03/2026	P06	Biscuits	Snacks	10	$1.00	$10.00
8	10/04/2026	P04	Soap (4-pack)	Household	1	$3.00	$3.00
9	10/05/2026	P07	Potato Chips	Snacks	7	$1.50	$10.50

Figure 2.1 – The shop sales file. The Formula Bar shows the formula in G5; the cell shows its result.

Key terms

Term	Meaning
Workbook	The whole Excel file (.xlsx)
Worksheet / Sheet	One page inside the file; names show on tabs at the bottom
Cell address	A cell's location, e.g. B7
Range	A group of cells, e.g. A5:A24 (A5 to A24)
Formula Bar	The bar at the top that shows a cell's real formula
Ribbon	The tabs at the top – Home, Insert, Data, Formulas...
Fill Handle	The small square at a cell's corner; drag it to copy a formula down

How to write a formula

Every formula starts with **=**. Example: G5 contains `=E5*F5`, i.e. Qty × Price. Press Enter and the result appears. Now select G5 and drag the Fill Handle down — every row gets its Amount, because Excel changes E5 to E6, E7... This is a **relative reference**.

The magic of $ – absolute references

Sometimes you don't want an address to change when copied. In the budget file every row is divided by total income (B4), so you write `$B$4`. Tip: while typing the formula, put the cursor on the address and press **F4** to add the $ signs.

```
=C9/$B$4  ← C changes, B4 always stays the same
```

Learn Excel Fast – Rajesh Kumar

CHAPTER 2

Know your Excel screen

The Ribbon at the top has many tabs. As a beginner you only need these 5:

Tab	What it's for	Most useful buttons
Home	Everyday formatting	Bold, colors, Borders, Number Format ($, %, date), Wrap Text, Merge, Conditional Formatting, AutoSum
Insert	Adding new things	PivotTable, Table, Charts, Picture
Formulas	Formula library	Insert Function (fx), Show Formulas, Trace Precedents
Data	Handling data	Sort, Filter, Remove Duplicates, Text to Columns, Data Validation
View	How you see the sheet	Freeze Panes, Zoom, Gridlines

Your first sheet – a 5-minute exercise

1. Open a new file. Type “Item” in A1, “Qty” in B1, “Price” in C1, “Amount” in D1.
2. Enter three items in A2:A4 with quantity and price in B and C.
3. In D2 type `=B2*C2`, press Enter, then drag D2's Fill Handle down to D4.
4. In D5 press **Alt** + **=** — the total appears.
5. Select row 1, make it Bold and add a fill color. Save with **Ctrl** + **S**. Congratulations — your first bill is ready!

Number format changes the look, not the value

Type 0.18 and format as % → you see 18%. Type 18 and format as % → you see 1800%! So always type percentages as **18%**. Likewise, Currency format (**Ctrl**+**1** → Currency → $) turns 125000 into $125,000.00 automatically.

⚠️ **Careful:** Never type a plain number into a green formula cell. That deletes the formula and every calculation after it goes wrong.

💡 **Tip:** What you see in a cell is not always its real value. Select the cell and look at the Formula Bar to see the real value or formula.

Learn Excel Fast · Rajesh Kumar

CHAPTER 3

Smart ways to enter data

- Always enter dates the same way, e.g. 10/16/2026 (or your country's format). If Excel recognises it as a date, DATEDIF, sorting and filtering all work. If a date sticks to the **left** of the cell, it has become text.
- Don't type $ or “dollars” in number cells. Type just 1500, then choose $ from Home → Number Format.
- Ctrl + D = copy the cell above down; Ctrl + ; = today's date.
- **Flash Fill** (Ctrl + E): type one or two examples and Excel fills the rest of the pattern (e.g. first names from full names).
- **Data Validation** (Data → Data Validation → List): create a dropdown so people can't enter wrong values. The P/A/L dropdown in the attendance file is made this way.
- **Freeze Panes** (View → Freeze Panes): the header stays visible while you scroll.
- **Format as Table** (Ctrl + T): instant filters, colors, and formulas that extend to new rows automatically.

C5 *fx* P (dropdown)

	A	B	C	D	E	F	G	H
4	Roll	Name	D1	D2	D3	D4	D5	D6
5	1	Ava	P	P	P	P	A	P
6	2	Liam	P	P	P	P	P	P
7	3	Noah	P	P	L	P	P	A
8	4	Zara	P	A	P	P	P	P
9	5	Omar	P	P	P	A	P	P

Figure 3.1 – Attendance file: every day column has a dropdown that allows only P, A or L.

> 💡 **Tip:** The Excel mobile app does all of this too — tap a cell, then use the fx button at the bottom to write a formula.

Learn Excel Fast · Raj Kumar

CHAPTER 4

The 20 most useful formulas

For each formula you get its meaning, how to write it (syntax) and a real example from the practice files. The highlighted cell is the one whose formula appears in the Formula Bar. Open the files and try it yourself.

1 SUM – add up

Adds a group of numbers.

```
=SUM(first_cell:last_cell)
```

I25 *fx* =SUM(I5:I24)

	F	G	H	I
21	$4.50	$13.50	$0.00	$13.50
22	$1.00	$5.00	$0.00	$5.00
23	$3.20	$28.80	$1.44	$27.36
24	$6.00	$42.00	$2.10	$39.90
25		$404.30	$13.34	**$390.96**

Total net sales of all 20 entries in one formula. Insert a row in the middle and the range grows automatically.

> 💡 **Tip:** Press Alt + = and Excel writes the SUM for you.

2 AVERAGE

The average of numbers (total ÷ count).

```
=AVERAGE(range)
```

B5 *fx* =ROUND(AVERAGE(Sales!I5:I24),2)

	A	B
4	Total net sales	$390.96
5	Average bill	**$19.55**
6	Largest bill	$76.00
7	Smallest bill	$3.00

What is the shop's average bill? ROUND keeps it to 2 decimals.

Learn Excel Fast Rajesh Kumar

CHAPTER 4 (CONTINUED)

The 20 most useful formulas

3 MAX and MIN – largest / smallest

The largest or smallest number in a range.

```
=MAX(range) =MIN(range)
```

B6 *fx* =MAX(Sales!I5:I24)

	A	B
6	Largest bill	**$76.00**
7	Smallest bill	$3.00

The month's biggest and smallest bill, instantly. Students can use it for highest/lowest marks.

4 COUNT and COUNTA – counting

COUNT counts only cells with numbers; COUNTA counts every filled cell.

```
=COUNT(range) =COUNTA(range)
```

C17 *fx* =COUNTA(B5:B14)

	A	C
17	Total students	**10**
18	Eligible students	8
19	Average attendance	77.5%

In the attendance file, total students = count of name cells (COUNTA), because names are text.

Learn Excel Fast · Kumar

CHAPTER 4 (CONTINUED)

The 20 most useful formulas

5 ROUND

Rounds a number to a set number of decimals.

```
=ROUND(number, decimals)
```

G11 *fx* =ROUND(E11*F11,2)

	E	F	G
10	Subtotal	Tax %	Tax
11	$50.00	10%	**$5.00**
12	$45.00	10%	$4.50
13	$84.00	10%	$8.40

Money should have only 2 decimals. Use ROUND(...,0) to round the amount payable to a whole dollar.

6 IF – if / then

One result if a condition is true, another if it's false.

```
=IF(condition, "if_true", "if_false")
```

E10 *fx* =IF(C10>B10,"Over budget","OK")

	A	B	C	D	E
8	Expense	Budget	Actual	Difference	Status
9	Rent	$700.00	$700.00	$0.00	OK
10	Groceries	$350.00	$382.00	$-32.00	**Over budget**
11	Electricity/Water	$100.00	$92.00	$8.00	OK
12	Phone/Internet	$40.00	$40.00	$0.00	OK
13	Kids' School	$250.00	$250.00	$0.00	OK

If actual spending is more than the budget, show “Over budget”, otherwise “OK”. Always put text inside " ".

> 💡 **Tip:** Conditions use > , < , >= , <= , = and <> (not equal).

Learn Excel Fast – Rajesh Kumar

CHAPTER 4 (CONTINUED)

The 20 most useful formulas

7 AND / OR – multiple conditions

AND = all conditions true; OR = at least one true.

```
=IF(AND(cond1, cond2), "Yes", "No")
```

L8 *fx* `=IF(AND(I8>=18,LEN(B8)=10),"Yes","No")`

	B	F	I	L
7	Phone	Clean Name	Age	Eligible?
8	5551234567	Maria Santos	28	**Yes**
9	5559876543	John Okafor	16	No
10	555 246 8101	Aisha Khan	41	No

A customer is eligible only if aged 18+ AND the phone number is exactly 10 digits. John Okafor is under 18; Aisha Khan's number has spaces (12 characters) — that's real-world messy data!

8 IFERROR – hide errors

Shows a clean message instead of #N/A or #DIV/0!.

```
=IFERROR(formula, "message")
```

B21 *fx* `=IFERROR(VLOOKUP("P99",Products!A5:D12,4,FALSE),"Wrong code")`

	A	B
19	Grocery + Card bills (COUNTIFS)	6
20	Price of P03 (INDEX+MATCH)	$3.20
21	Price of P99 (IFERROR)	**Wrong code**

There is no product P99. Without IFERROR you'd see #N/A; now you see “Wrong code”.

Learn Excel Fast – Rajesh Kumar

CHAPTER 4 (CONTINUED)

The 20 most useful formulas

9 COUNTIF – count with a condition

How many cells meet a condition.

```
=COUNTIF(range, "condition")
```

O5 *fx* =COUNTIF(C5:N5,"P")

	B	D1	D2	D3	D4	D5	D6	D7	D8	D9	D10	D11	D12	O	P	Q	R
4	Name	D1	D2	D3	D4	D5	D6	D7	D8	D9	D10	D11	D12	Pres.	Days	%	Result
5	Ava	P	P	P	P	A	P	P	P	P	P	A	P	**10**	12	83%	Eligible
6	Liam	P	P	P	P	P	P	P	P	L	P	P	P	11	12	92%	Eligible
7	Noah	P	P	L	P	P	A	L	P	P	P	A	L	7	12	58%	Low attendance

How many “P”s each student has. Number conditions work too: COUNTIF(I5:I24,">=40") = bills of $40 or more.

10 COUNTIFS – count with several conditions

Two or more conditions at once.

```
=COUNTIFS(range1,"cond1", range2,"cond2")
```

B19 *fx* =COUNTIFS(Sales!D5:D24,"Grocery",Sales!J5:J24,"Card")

	A	B
19	Grocery + Card bills (COUNTIFS)	**6**
20	Price of P03 (INDEX+MATCH)	$3.20

How many bills were in the Grocery category AND paid by card.

Learn Excel Fast – Rajesh Kumar

CHAPTER 4 (CONTINUED)

The 20 most useful formulas

11 SUMIF – add with a condition

Adds only the rows that meet a condition.

```
=SUMIF(criteria_range, criteria, sum_range)
```

B5 *fx* `=SUMIF(Ledger!$A$7:$A$40,A5,Ledger!$C$7:$C$40)`

	A	B	C	D
4	Customer	Total Credit	Total Paid	Balance Due
5	Maria	**$92.00**	$45.00	$47.00
6	John	$42.50	$42.50	$0.00
7	Aisha	$115.00	$50.00	$65.00
8	David	$22.50	$10.00	$12.50
9	Total	$272.00	$147.50	$124.50

In the credit ledger: each customer's total credit and total paid. Balance = credit – paid. Your whole tab book in one formula.

12 SUMIFS – add with several conditions

Adds rows that meet two or more conditions.

```
=SUMIFS(sum_range, range1,cond1, range2,cond2)
```

D14 *fx* `=SUMIFS(Sales!$I$5:$I$24,Sales!$D$5:$D$24,A14,Sales!$J$5:$J$24,"Card")`

	A	B	C	D
13	Category	Net Sales	Bills	Card Sales
14	Grocery	$279.61	10	**$158.11**
15	Household	$56.85	4	$0.00
16	Snacks	$54.50	6	$33.50
17	Total	$390.96	20	$191.61

Note: in SUMIFS the range to add comes **first**; in SUMIF it comes **last**. This is the most common mistake.

Learn Excel Fast – Rajesh Kumar

CHAPTER 4 (CONTINUED)

The 20 most useful formulas

13 VLOOKUP – find in a list

Look up a code/name in a list and bring back other information from the same row.

```
=VLOOKUP(what_to_find, table, column_number, FALSE)
```

C5 *fx* `=VLOOKUP(B5,Products!$A$5:$D$12,2,FALSE)`

	A	B	C	D	E	F
4	Date	Code	Product	Category	Qty	Price
5	10/01/2026	P06	**Biscuits**	Snacks	3	$1.00
6	10/02/2026	P01	Rice 5kg	Grocery	2	$8.00
7	10/03/2026	P06	Biscuits	Snacks	10	$1.00
8	10/04/2026	P04	Soap (4-pack)	Household	1	$3.00

In the Sales sheet you type only the product Code; the name (column 2) and price (column 4) come from the Product List automatically. FALSE at the end = exact match.

> 💡 **Tip:** Don't forget the $ signs on the table range, or it will shift when you copy down.

14 XLOOKUP – the new, easier lookup

VLOOKUP's upgrade: looks left or right, and has a built-in "not found" message.

```
=XLOOKUP(what_to_find, look_in, return_from, "if_not_found")
```

D5 *fx* `=XLOOKUP(B5,Products!$A$5:$A$12,Products!$C$5:$C$12,"Not found")`

	A	B	C	D	E
4	Date	Code	Product	Category	Qty
5	10/01/2026	P06	Biscuits	**Snacks**	3
6	10/02/2026	P01	Rice 5kg	Grocery	2
7	10/03/2026	P06	Biscuits	Snacks	10
8	10/04/2026	P04	Soap (4-pack)	Household	1

The category comes from XLOOKUP — no counting column numbers. (Excel 2021/365 and Google Sheets.)

Learn Excel Fast – Rajesh Kumar

CHAPTER 4 (CONTINUED)

The 20 most useful formulas

15 INDEX + MATCH – old but powerful

MATCH finds the position, INDEX returns the value at that position. Works in every Excel version.

```
=INDEX(return_range, MATCH(what_to_find, lookup_range, 0))
```

B20 *fx* `=INDEX(Products!D5:D12,MATCH("P03",Products!A5:A12,0))`

	A	B
19	Grocery + Card bills (COUNTIFS)	6
20	Price of P03 (INDEX+MATCH)	**$3.20**

Finds the price of code P03 (Sugar 2kg): $3.20.

16 TEXT – show numbers/dates your way

Converts a date or number to text in any format.

```
=TEXT(value, "format")
```

B4 *fx* `="INV-"&TEXT(B6,"YYMMDD")&"-"&TEXT(B5,"000")`

	A	B
4	Invoice No.	**INV-261016-027**
5	Bill serial	27
6	Date	10/16/2026

The invoice number builds itself from the date and serial: INV-261016-027. Formats: "MM/DD/YYYY", "MMM" (Oct), "dddd" (Friday), "000" (027).

Learn Excel Fast

CHAPTER 4 (CONTINUED)

The 20 most useful formulas

17 DATE – build a date from day/month/year

Turns separate day, month and year columns into a real date.

```
=DATE(year, month, day)
```

H8 *fx* =DATE(E8,D8,C8)

	C	D	E	F	H
7	Day	Month	Year	Clean Name	Birth Date
8	5	3	1998	Maria Santos	**03/05/1998**
9	21	11	2009	John Okafor	11/21/2009

Data exported from forms often has day, month and year separately. Combine them with DATE and you can sort and calculate ages.

18 TODAY and DATEDIF – today's date, age, days

TODAY() changes every day. DATEDIF gives the gap between two dates in years ("y"), months ("m") or days ("d").

```
=TODAY() =DATEDIF(start, end, "y")
```

I8 *fx* =DATEDIF(H8,$B$4,"y")

	H	I
7	Birth Date	Age (yrs)
8	03/05/1998	**28**
9	11/21/2009	16
10	07/14/1985	41

Age in years. In the credit ledger, “Days” = today – credit date (subtracting two dates gives days). Credit older than 30 days turns red.

Learn Excel Fast Rajesh Kumar

CHAPTER 4 (CONTINUED)

The 20 most useful formulas

19 TRIM, PROPER, UPPER – clean up text

TRIM removes extra spaces; PROPER capitalises each word; UPPER/LOWER make everything upper/lower case.

```
=PROPER(TRIM(A8))
```

F8 *fx* =PROPER(TRIM(A8))

	A	B	F
7	Name (raw)	Phone	Clean Name
8	“ maria santos ”	5551234567	**Maria Santos**
9	“JOHN okafor”	5559876543	John Okafor
10	“aisha khan”	555 246 8101	Aisha Khan
11	“david LEE”	5551357913	David Lee

“ maria santos ” becomes “Maria Santos”. The fastest way to clean a customer list.

20 LEFT, RIGHT, MID, & – split and join text

LEFT/RIGHT take characters from the start/end; MID from the middle; & joins text.

```
=LEFT(B8,3)&"-"&MID(B8,4,3)&"-"&RIGHT(B8,4)
```

G8 *fx* =LEFT(B8,3)&"-"&MID(B8,4,3)&"-"&RIGHT(B8,4)

	B	F	G	K
7	Phone	Clean Name	Phone (formatted)	Customer ID
8	5551234567	Maria Santos	**555-123-4567**	C-MA4567
9	5559876543	John Okafor	555-987-6543	C-JO6543
10	5551357913	David Lee	555-135-7913	C-DA7913

Phone 5551234567 becomes readable: 555-123-4567. Customer ID = "C-" + first 2 letters of the name + last 4 digits of the phone.

Recognise the errors

#N/A = value not found; **#DIV/0!** = divided by zero; **#VALUE!** = text where a number should be; **#NAME?** = formula name misspelled; **####** = column too narrow, widen it.

Licensed copy – do not share or resell

CHAPTER 4 (CONTINUED)

Common mistakes and how to fix them

Problem	Cause	Fix
The formula shows as text	Cell is formatted as Text, or there's a space before =	Set format to General, press F2 → Enter
SUM gives too little	Some numbers are stored as text	Data → Text to Columns → Finish, or click the green triangle → Convert to Number
Wrong results when dragged down	No $ on the range	Press F4 to make it $A$5:$D$12
VLOOKUP gives #N/A	No FALSE / spaces in the code / number stored as text	Add FALSE, use TRIM, keep both sides the same format
Date shows as a number like 46311	Cell is formatted as Number	Ctrl + 1 → Date
Result doesn't update	Calculation is set to Manual	Formulas → Calculation Options → Automatic
Circular Reference warning	Formula includes its own cell	Remove that cell from the range
Names and amounts mismatched after sorting	Only one column was sorted	Ctrl + Z, then select the whole table and sort

3 ways to check a formula

- **Check 2 rows by hand** – verify two or three results with a calculator.
- Ctrl + ` – shows all formulas at once; a broken pattern stands out.
- **Formulas → Evaluate Formula** – watch a long formula solve step by step.

Learn Excel Fast – Raj Kumar

CHAPTER 5

Sorting and filtering

Sort = put in order (A→Z, small→large, old→new). **Filter** = show only chosen rows and hide the rest (nothing is deleted).

Step by step (03_shop_sales.xlsx)

1. Click any cell in the header row (row 4).
2. Data → Filter (or Ctrl + Shift + L). A ▼ arrow appears on every header.
3. Click ▼ on "Payment" → tick only "Credit" → OK. Now only credit sales show.
4. ▼ on "Net" → Sort Largest to Smallest: biggest bills on top.
5. Number Filters → Greater Than → 40: only bills over $40.
6. To remove filters: Data → Clear.

A4 *fx* Data → Filter

	A	B	C	D	E	F	G	H	I	J
4	Date	Code	Product	Category	Qty	Price	Amount	Disc.	Net	Payment
5	10/01/2026	P06	Biscuits	Snacks	3	$1.00	$3.00	$0.00	$3.00	Credit
6	10/02/2026	P01	Rice 5kg	Grocery	2	$8.00	$16.00	$0.00	$16.00	Cash
7	10/03/2026	P06	Biscuits	Snacks	10	$1.00	$10.00	$0.00	$10.00	Cash
8	10/04/2026	P04	Soap (4-pack)	Household	1	$3.00	$3.00	$0.00	$3.00	Cash
9	10/05/2026	P07	Potato Chips	Snacks	7	$1.50	$10.50	$0.00	$10.50	Card
10	10/06/2026	P04	Soap (4-pack)	Household	2	$3.00	$6.00	$0.00	$6.00	Credit
11	10/07/2026	P01	Rice 5kg	Grocery	10	$8.00	$80.00	$4.00	$76.00	Cash
12	10/08/2026	P04	Soap (4-pack)	Household	11	$3.00	$33.00	$1.65	$31.35	Cash

Figure 5.1 – The sales register before filtering. Net bills of $40+ are highlighted yellow by Conditional Formatting.

⚠️ **Careful:** When sorting, click one cell in the table — don't select just one column. Otherwise only that column moves and names and amounts get mixed up!

💡 **Tip:** With a filter on, a normal SUM still adds hidden rows. To add only visible rows use `=SUBTOTAL(9,I5:I24)`.

Learn Excel Fast · Rajesh Kumar

CHAPTER 6

Pivot Tables – reports in minutes

Imagine you have 500 rows of sales and your boss asks: “How much did we sell in each category, and how much was paid by card?” A Pivot Table answers in 30 seconds — without a single formula.

How to build one

1. Click any cell in the sales table → Insert → PivotTable → OK (New Worksheet).
2. A field list appears on the right. Drag “Category” to **Rows**.
3. Drag “Net” to **Values** — it becomes “Sum of Net”.
4. Drag “Payment” to **Columns** — Cash/Card/Credit for each category.
5. Put “Date” in **Filters** to see a single week.
6. When data changes: right-click the Pivot → Refresh.

Below is the same report a Pivot Table gives — the practice file's Summary sheet builds it with SUMIF/SUMIFS so you can compare your Pivot's result:

B14 *fx* `=SUMIF(Sales!$D$5:$D$24,A14,Sales!$I$5:$I$24)`

	A	B	C	D
13	Category	Net Sales	Bills	Card Sales
14	Grocery	$279.61	10	$158.11
15	Household	$56.85	4	$0.00
16	Snacks	$54.50	6	$33.50
17	Total	$390.96	20	$191.61

Figure 6.1 – Sales by category (Pivot-style result). Your Pivot Table should show these same numbers.

> 💡 **Tip:** In Values, right-click → Show Values As → % of Grand Total: each category's share as a percentage.

Learn Excel Fast · Pooja Kumar

CHAPTER 7

Charts – a picture of your numbers

One chart is easier to understand than a long list of numbers. Making a chart in Excel takes 3 clicks.

1. Select the data (with headers) — e.g. A8:C18 in the budget file.
2. Insert → Recommended Charts → Clustered Column → OK.
3. Click the chart and use the "+" button to add Chart Title and Data Labels.

Chart	Use it for	Example
Column / Bar	Comparing	Budget vs actual, sales by category
Line	Change over time	Month-by-month sales
Pie	Share of a whole (up to 5–6 slices)	Rent's share of total spending

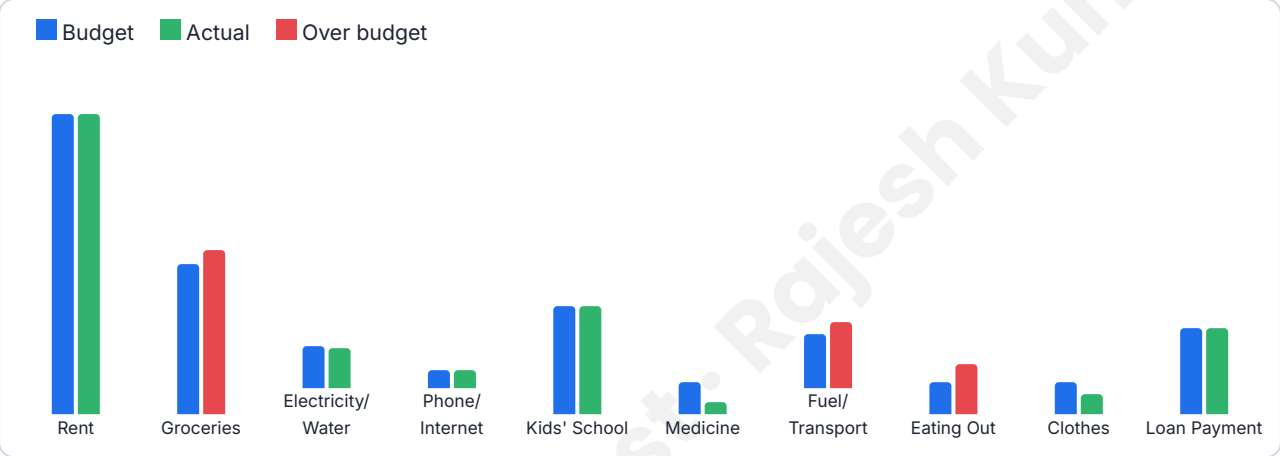

Figure 7.1 – "Budget vs Actual" chart from 05_home_budget.xlsx. The file already contains this chart.

Make decisions from the chart

Groceries, Fuel/Transport and Eating Out all went over budget. Next month, focus on exactly those. That's the real value of a chart: you see the problem at a glance.

💡 **Tip:** To share a chart in PowerPoint, email or WhatsApp: right-click the chart → Copy → Paste wherever you like, or use "Save as Picture".

Learn Excel Fast · Rajesh Kumar

CHAPTER 8

Conditional Formatting – automatic colors

Cells change color automatically based on a rule. For example: overspending in red, attendance below 75% in red, bills of $40+ in yellow.

1. Select the range (e.g. Q5:Q14 in the attendance file).
2. Home → Conditional Formatting → Highlight Cells Rules → Less Than.
3. Type 75% in the box, choose “Light Red Fill” → OK.
4. To remove: Conditional Formatting → Clear Rules.

	Name	D1	D2	D3	D4	D5	D6	D7	D8	D9	D10	D11	D12	Pres.	%	Result
5	Ava	P	P	P	P	A	P	P	P	P	P	A	P	10	83%	Eligible
6	Liam	P	P	P	P	P	P	P	P	L	P	P	P	11	92%	Eligible
7	Noah	P	P	L	P	P	A	L	P	P	P	A	L	7	58%	Low attendance
8	Zara	P	A	P	P	P	P	P	P	P	L	A	P	9	75%	Eligible
9	Omar	P	P	P	A	P	P	P	P	P	A	P	L	9	75%	Eligible
10	Grace	P	P	P	P	P	L	P	P	P	P	P	P	11	92%	Eligible
11	Ethan	P	P	L	P	P	P	P	P	L	P	P	P	10	83%	Eligible
12	Fatima	L	P	A	P	L	P	P	P	P	A	L	P	7	58%	Low attendance
13	Lucas	L	P	P	P	P	P	P	A	P	P	P	P	10	83%	Eligible
14	Mia	P	P	P	P	P	P	P	L	L	L	P	P	9	75%	Eligible

Figure 8.1 – Students below 75% attendance in red. In the file, every “A” (Absent) also shows in red letters.

More useful rules

- **Data Bars** – a mini bar chart inside the cell (great for progress in a study planner).
- **Color Scales** – green-yellow-red from low to high.
- **Duplicate Values** – did the same bill number or phone get entered twice?
- **Use a formula** – to color a whole row: select the range, formula `=$R5="Low attendance"`.

Learn Excel Fast · rajeshkumar

CHAPTER 9

Using ChatGPT / Gemini for Excel

Now the fun part. You don't need to memorise every formula — you can ask the free ChatGPT (chatgpt.com) or Google Gemini (gemini.google.com) in plain English. You just need to ask the right way.

The formula for a good prompt

Task + where your data is (columns/range) + condition + where you want the result + your Excel version

❌ Weak prompt	✅ Good prompt
formula for customer balance	In my sheet, column A has customer names, C has credit given and D has payments (rows 7 to 16). Give me a formula for Maria's balance. I use Excel 2019.

3 big jobs to hand to AI

1. **Writing formulas:** describe what you need. AI gives a formula — copy it into the cell and check 2–3 rows by hand.
2. **Cleaning data:** give AI a messy list (mixed-case names, spaces in numbers, different date formats) and ask which formula or Flash Fill to use. For short lists (up to ~50 rows) you can paste them and ask for a clean table.
3. **Designing a whole sheet:** "Design a stock sheet for my clothing store — which columns and which formulas." AI gives a table; paste it into Excel (Ctrl + Shift + V = paste as text only).

⚠️ **Careful: Privacy:** never paste customers' phone numbers, ID numbers, bank details or other private data into AI. Replace names with "Customer1, Customer2" or use fake numbers.

💡 **Tip:** AI sometimes gives a wrong formula, or a new function (like XLOOKUP) that your older Excel doesn't have. Always state your Excel version and check 2–3 results yourself.

Learn Excel Fast · Rajesh Kumar

CHAPTER 9 (CONTINUED)

Real examples with AI

You: Column C in my sheet has marks (out of 100). In column D I want a grade: A+ for 90+, A for 75+, B for 60+, C for 33+, otherwise D. I use Excel 2019.

AI (summary): In D2 write:
`=IF(C2>=90,"A+",IF(C2>=75,"A",IF(C2>=60,"B",IF(C2>=33,"C","D"))))`
then drag it down. Excel 2019 also has IFS: `=IFS(C2>=90,"A+",C2>=75,"A",…,TRUE,"D")`

Check: 76 marks → A ✓, 32 marks → D ✓.

You: Column A has names like " maria santos ", "JOHN okafor". Give me a formula to clean them into "Maria Santos".

AI (summary): `=PROPER(TRIM(A2))` — TRIM removes extra spaces, PROPER capitalises each word. Then copy the column and use Paste Special → Values.

You: Why does this formula give #N/A? `=VLOOKUP(B5,Products!A5:D12,2)`

AI (summary): Two likely reasons: (1) there's no FALSE at the end, (2) the range has no $ so it shifted when copied. Correct: `=VLOOKUP(B5,Products!$A$5:$D$12,2,FALSE)` . Also check for spaces before/after the code.

Gemini + Google Sheets

Open your file in Google Sheets and ask Gemini right there. Upload any Excel file from this pack to Google Drive and open it with Sheets — everything works.

Licensed copy – do not share or resell

CHAPTER 10

30 ready-to-use AI prompts

Copy a prompt, replace the [brackets] with your own details, and paste it into ChatGPT or Gemini. Tip: add “I use Excel 2019” (or your version) at the end.

1 FORMULA

Column A has customer names and column C has amounts (rows 2–200). Give a SUMIF formula for each customer's total.

2 FORMULA

Write an IF formula: show “Over” if D2 is more than C2, otherwise “OK”.

3 FORMULA

Sheet2 has product codes (A) and prices (D). Return the price for the code in Sheet1!B2 using both VLOOKUP and XLOOKUP.

4 FORMULA

Birth date is in B2. Calculate age in years, months and days as of today.

5 FORMULA

Attendance sheet with P/A in C:AF. Give a formula for attendance % and flag “Low” if below 75%.

6 FORMULA

$20,000 loan, 9.5% annual interest, 5 years — give formulas for the monthly payment and total interest.

7 FORMULA

B2 is a tax-inclusive price and C2 is the tax/VAT %. Split it into the price before tax and the tax amount.

8 FORMULA

Explain this formula step by step in simple language: [paste formula]

9 FORMULA

My formula returns #N/A / #VALUE!: [formula]. Sample data: [2 rows]. Find the error and fix it.

10 FORMULA

Give me a SUMIFS to total sales by month and category. Date in A, category in B, amount in D.

Learn Excel Fast · Rajesh Kumar

Licensed copy – do not share or resell

CHAPTER 10 (CONTINUED)

30 ready-to-use AI prompts

11 DATA CLEANING

Names in column A have extra spaces and mixed upper/lower case. Give a formula to clean them.

12 DATA CLEANING

Phone numbers contain country codes (+63, +234...), spaces and dashes. Extract just the clean local number.

13 DATA CLEANING

Dates are in mixed formats (05/10/2026, 5-Oct-26, 2026.10.05). How do I convert them all to one real date format?

14 DATA CLEANING

Column A has "Name - Number". Split the name and number into two columns, using a formula and Text to Columns.

15 DATA CLEANING

My list has duplicate customers. Show the steps to highlight them with color and remove them.

16 DATA CLEANING

Convert this messy list into a clean table (Name | City | Amount): [paste 10–20 rows — remove private data]

17 DATA CLEANING

Some numbers are stored as text, stick to the left and SUM ignores them. How do I convert them to numbers?

18 DATA CLEANING

Data from a Google Form has several comma-separated answers in one cell. How do I split them into columns?

19 BUILD A SHEET

Design a stock sheet for my small shop: columns, a formula for each column, and a low-stock alert. Give it as a table.

20 BUILD A SHEET

Create a monthly payroll sheet for 10 staff: basic pay, allowance 20%, deductions 10%, advance, net pay — with formulas.

Learn Excel Fast · Rajesh Kumar

Licensed copy – do not share or resell

CHAPTER 10 (CONTINUED)

30 ready-to-use AI prompts

21 BUILD A SHEET

Make a 60-day exam study planner: subject, topic, target hours, hours done, progress %.

22 BUILD A SHEET

Build a customer credit ledger with a running balance per customer that highlights dues older than 30 days in red.

23 BUILD A SHEET

Suggest a household budget dashboard: which 4 numbers to show on top and which chart to use.

24 BUILD A SHEET

Create a small-business invoice layout: tax/VAT per line, rounded total, automatic invoice number.

25 BUILD A SHEET

Which Pivot Table should I build from this data so my manager can see sales by month and category? Give the steps.

26 LEARNING

Teach me Excel from zero: a 7-day plan, 20 minutes a day, with one small exercise each day.

27 LEARNING

Explain the difference between VLOOKUP and XLOOKUP using a shop example.

28 LEARNING

List the 15 most useful Excel shortcuts for office work, with what each does.

29 LEARNING

Quiz me with 10 interview-style Excel questions, one at a time, and check my answers.

30 LEARNING

Look at this screenshot of my sheet and suggest how to make it cleaner and easier to use. [attach screenshot — hide private data]

Learn Excel Fast · Rajesh Kumar

Licensed copy – do not share or resell

CHAPTER 11

Practice assignments

Open each file and do these tasks yourself. Check your answers against the formulas already in the files.

03_shop_sales.xlsx

- In Products, change P05's price from $5.50 to $5.99 — watch the Sales sheet update itself.
- In Summary, write your own COUNTIF to count “Cash” bills.
- Build a Pivot Table from Sales: Rows = Category, Columns = Payment, Values = Net.

04_customer_credit_ledger.xlsx

- Add a new row: “John” took $30 credit. See his balance in Customer_Summary.
- Change the date in B4 and watch how “Status” changes.

05_home_budget.xlsx

- Enter your real income and spending.
- Add a new column G “% Used” (actual ÷ budget) and apply Data Bars.

06_attendance.xlsx

- Add a day D13 and extend the formula ranges.
- Create a Conditional Formatting rule that colors the whole row red for “Low attendance” students.

07_sales_invoice.xlsx

- Add a new item (tax 5%) and check the totals update.
- Change the bill serial from 27 to 28 — the invoice number changes automatically.

E7 *fx* `=SUMIF($A$7:A7,A7,$C$7:C7)-SUMIF($A$7:A7,A7,$D$7:D7)`

	A	B	C	D	E	F	G
6	Customer	Date	Credit	Paid	Balance	Days	Status
7	Maria	09/02/2026	$60.00	$0.00	$60.00	48	Old - send reminder
8	John	09/05/2026	$42.50	$0.00	$42.50	45	Old - send reminder
9	Maria	09/12/2026	$0.00	$25.00	$35.00	38	Paid
10	Aisha	09/15/2026	$115.00	$0.00	$115.00	35	Old - send reminder
11	John	09/20/2026	$0.00	$42.50	$0.00	30	Paid
12	Maria	09/28/2026	$32.00	$0.00	$67.00	22	OK

CHAPTER 12

Mobile, Google Sheets & a 7-day plan

No computer? No problem. All these files work on your phone too.

- **Microsoft Excel app** (Android/iPhone) – open and edit files with a free Microsoft account. For formulas, tap a cell, then fx at the bottom.
- **Google Sheets app** – upload the .xlsx to Google Drive and open it in Sheets. Optionally File → Save as Google Sheets.
- **Sharing** – send the file directly as a document on WhatsApp/email, or File → Download → PDF to send a bill.
- **Printing** – Page Layout → Orientation (Landscape) and "Fit to 1 page wide" so the table fits on one page.

Your 7-day learning plan

Day	What to learn	Which file
1	Cells, rows, columns, your first bill	Chapter 2
2	SUM, AVERAGE, MAX/MIN, ROUND	05_home_budget
3	IF, AND/OR, COUNTIF	06_attendance
4	SUMIF, VLOOKUP/XLOOKUP	03_shop_sales, 04_customer_credit_ledger
5	TEXT, DATE, TRIM; Sort/Filter	Formula_Lab sheet
6	Pivot, Charts, Conditional Formatting	03_shop_sales, 05_home_budget
7	Build your own sheet with AI prompts	Chapters 9–10, 07_sales_invoice

Learn Excel Fast – Rajesh Kumar

CHAPTER 13

Excel Tables, Remove Duplicates & Find/ Replace

Turn your data into a real Table

Click any cell inside the sales data (A4:J24) and press Ctrl+T → tick “My table has headers” → OK. Then on the **Table Design** tab, set **Table Name** to `Sales`. You now get: filter arrows, banded rows, and formulas/charts that grow automatically when you add a new row at the bottom.

Structured references – formulas that read like English

Old way	Table way	Result
=SUM(I5:I24)	=SUM(Sales[Net])	$390.96
=SUMIF(D5:D24,"Grocery",I5:I24)	=SUMIF(Sales[Category],"Grocery",Sales[Net])	$279.61
=COUNTIF(J5:J24,"Credit")	=COUNTIF(Sales[Payment],"Credit")	3

Add a 21st sale under the table and `=SUM(Sales[Net])` includes it automatically — the old `I5:I24` would miss it. Tick **Total Row** on Table Design to get a sum/average dropdown under any column.

Remove Duplicates (step by step)

1. First make a copy of the sheet (right-click tab → Move or Copy → tick Create a copy). Removing is permanent once saved.
2. Select the data → **Data → Remove Duplicates**.
3. Tick only the columns that define a duplicate (e.g. Customer + Date + Amount), then OK. Excel tells you how many rows it removed.

Find & Replace

Ctrl+F finds; Ctrl+H replaces. Example: replace “Soap (4-pack)” with “Soap 4pk” in every row at once. Click **Options** → tick “Match entire cell contents” so you don't change parts of other words.

Manage sheets

Double-click a sheet tab to rename it, right-click → Tab Color to color it, drag a tab to move it. To use a value from another sheet, write the sheet name and !: `=Products!C5`.

Learn Excel Fast Rajesh Kumar

CHAPTER 13

Modern formulas: FILTER, UNIQUE, SORT

Excel 365/2021 and Google Sheets have formulas that return many cells at once. You type in one cell and the answer "spills" down. (Not in Excel 2019 or older.)

UNIQUE – a list without repeats

In an empty cell L5 of the Sales sheet: `=UNIQUE(D5:D24)` → Grocery, Household, Snacks. Next to it in M5: `=SUMIF(D5:D24,L5#,I5:I24)` → $279.61, $56.85, $54.50 (the **#** means "the whole spilled list").

FILTER – pull out matching rows

`=FILTER(A5:I24,J5:J24="Credit","None")` returns every credit sale:

Date	Product	Net
10/01/2026	Biscuits	$3.00
10/06/2026	Soap (4-pack)	$6.00
10/13/2026	Detergent 1kg	$16.50

Two conditions: multiply them. `=FILTER(A5:I24,(D5:D24="Grocery")*(J5:J24="Card"))`. The last part ("None") is shown when nothing matches, instead of a #CALC! error.

SORT and SORTBY

`=SORT(FILTER(A5:I24,I5:I24>=30),9,-1)` → sales of $30 or more, biggest first (9 = 9th column of the range, −1 = descending): Rice 5kg $76.00, Coffee 200g $39.90, Soap (4-pack) $31.35, Rice 5kg $30.40.

> 💡 **Tip:** Spilled results update the moment the data changes, so they are great for a "live" report. If you see **#SPILL!**, something is blocking the cells below — clear them.

IFS and SWITCH – cleaner than nested IF

`=IFS(I5>=50,"Big",I5>=20,"Medium",TRUE,"Small")` — checks in order; TRUE = "everything else". `=SWITCH(J5,"Cash","C","Card","K","Credit","Due")` swaps one exact value for another.

Learn Excel Fast · Rajesh Kumar

CHAPTER 13

Money formulas & What-If: PMT, Goal Seek

PMT – the monthly loan payment

Loan $20,000 at 9.5% a year for 5 years:

B5 *fx* `=PMT(B2/12,B3*12,-B1)`

	A	B
1	Loan amount	$20,000.00
2	Interest (yearly)	9.5%
3	Years	5
5	Monthly payment	**$420.04**
6	Total interest	$5,202.23

*Figure 13.1 – PMT needs rate per month (÷12), number of months (×12) and the loan (minus sign so the answer is positive). Total interest B6 = B5*B3*12-B1.*

Goal Seek – work backwards

"What loan can I take if I can pay only $350 a month?" Select B5 → **Data → What-If Analysis → Goal Seek** → Set cell **B5**, To value **350**, By changing cell **B1** → OK. Excel changes the loan to about **$16,665**.

Same idea in the budget file: "How much must I cut from Eating out so savings reach $X?" — Set cell = Savings, By changing = Eating out budget.

Percent change

`=(New-Old)/Old`, formatted as %. If last month was $350 and this month is $390.96: `=(390.96-350)/350` → **11.7%** growth.

⚠️ **Careful:** Goal Seek overwrites the input cell. Undo with Ctrl + Z if you only wanted to look.

Learn Excel Fast · Rajesh Kumar

CHAPTER 13

Build a one-page dashboard

A dashboard = the 4–6 numbers and 1–2 charts your boss (or you) looks at every day. Build it on a new sheet called **Dashboard** from the shop sales file.

Step 1 – KPI boxes (big numbers at the top)

Box	Formula	Value
Total sales	=SUM(Sales!I5:I24)	$390.96
Bills	=COUNT(Sales!I5:I24)	20
Average bill	=AVERAGE(Sales!I5:I24)	$19.55
Biggest bill	=MAX(Sales!I5:I24)	$76.00
Credit sales	=SUMIF(Sales!J5:J24,"Credit",Sales!I5:I24)	$25.50

Make each value big (20 pt, bold), put it in a light colored box with a label above it.

Step 2 – PivotTable + PivotChart

1. Click in the sales data → **Insert → PivotTable** → New Worksheet. Rows = Category, Values = Sum of Net.
2. Click inside the pivot → **PivotTable Analyze → PivotChart** → Column chart. Cut and paste the chart onto Dashboard.

Step 3 – a Slicer (clickable filter buttons)

Click the pivot → **PivotTable Analyze → Insert Slicer** → tick Payment. Now clicking “Cash” or “Card” changes the pivot and the chart instantly. Move the slicer to the Dashboard too.

Step 4 – tidy up

- View → untick Gridlines for a clean look.
- After adding new sales: Data → **Refresh All** (pivots do not update by themselves).
- If your data is a Table (page before), the pivot picks up new rows automatically on refresh.

Learn Excel Fast · Rajesh Kumar

CHAPTER 13

Printing, protecting & sharing

Print a sheet neatly on one page

1. **File → Print** (Ctrl+P) to see the preview first.
2. Settings: choose Landscape for wide sheets.
3. Scaling: **Fit All Columns on One Page** — no more one column on page 2.
4. Print only part: select the cells → **Page Layout → Print Area → Set Print Area**.
5. Long lists: **Page Layout → Print Titles → Rows to repeat at top** = $4:$4, so headings appear on every page.
6. Want a PDF (e.g. the invoice)? File → Save As / Export → PDF.

Protect formulas from accidents

1. Select the yellow input cells → Ctrl+1 → Protection → untick **Locked**.
2. **Review → Protect Sheet** → (optional password) → OK.
3. Now people can type in input cells, but the green formula cells cannot be changed. To edit later: Review → Unprotect Sheet.

Protect Workbook (Review tab) stops people adding, deleting or renaming sheets. **File → Info → Protect Workbook → Encrypt with Password** asks for a password just to open the file.

> ⚠️ **Careful:** If you forget an Encrypt password, Microsoft cannot recover it. Write it down somewhere safe.

Share and comment

- Save the file to OneDrive → **Share** (top right) → people can edit at the same time.
- Right-click a cell → **New Comment** to ask a question; others can reply.
- Before sending a file outside: File → Info → **Check for Issues → Inspect Document** removes hidden personal info.

Learn Excel Fast – Santosh Kumar

CHAPTER 13

Copilot in Excel

Copilot is Microsoft's AI built into Excel. It needs a Microsoft 365 subscription that includes Copilot; the file is usually saved on OneDrive/SharePoint with AutoSave on. If you don't see the Copilot button on the Home tab, you don't have it — use ChatGPT/Gemini as in Chapter 9 instead.

How to use it

1. Format your data as a Table first (Ctrl + T) — Copilot works best with clear headings.
2. **Home → Copilot**. A panel opens on the right.
3. Type a request in plain English. Copilot shows a preview; click **Insert** / **Apply** to keep it.

Good requests for the sales file

- "Add a column that shows Net minus 5% as Profit."
- "Show total Net by Category as a chart."
- "Highlight sales above $30 in green."
- "Which product sold the most quantity?"
- "Explain the formula in column I."

Always check AI work

Copilot, ChatGPT and Gemini can be wrong. After any AI formula, test it on 2–3 rows you can check by hand (e.g. the total should still be $390.96). You should understand the formula before you trust it — that is why the earlier chapters matter.

Learn Excel Fast ... esh Kumar

CHAPTER 14

Shortcut cheat sheet & next steps

Ctrl + C / V / X	Copy / Paste / Cut	Ctrl + Z / Y	Undo / Redo
Ctrl + S	Save	Alt + =	AutoSum
Ctrl + T	Create Table	Ctrl + Shift + L	Filter on/off
Ctrl + E	Flash Fill	Ctrl + D	Fill down from cell above
Ctrl + ;	Today's date	F2	Edit cell
F4	Add $ (absolute)	Ctrl + Arrow	Jump to last cell of data
Ctrl + Shift + Arrow	Select to there	Ctrl + 1	Format Cells
Ctrl + `	Show/hide all formulas	Alt + Enter	New line inside a cell
Ctrl + Space / Shift + Space	Select whole column / row	Ctrl + Page Up/Down	Next / previous sheet

What next?

- Move one daily task (expenses, attendance, sales) from paper to Excel.
- Each week pick one new formula and ask AI for 3 examples of it.
- Build your own templates from the 30 prompts — budget, stock, invoices, planners.

Thank you! 🙏
